

# Storage Tank Cleaning & Removal

## Client – Morrison Construction Project – Tank Decommissioning & Removal, Olympic Village

This extensive project involved the removal of numerous oil and fuel storage tanks within the site that was being prepared for the London 2012 Olympics.

### The Scope of Works included the cleaning, degassing and removal of the following tanks:

- 1 No. 25,000 litre above ground oil storage tank from the BOC Gases depot.
- 6 No. above ground storage tanks in various sizes ranging from 2,700 litre to 24,000 litre from the Pentaluck and East Cross areas.
- Decommissioning of the Total Service Station, consisting of the breaking over, cleaning, degassing and excavation of 4 No. below ground petroleum spirit tanks, totalling 110,000-litres.
- Once the project environmental consultants confirmed the ground was free of hydro-carbon contamination, the excavated tank farm was back filled with certificated Type 1 re-cycled crushed concrete, in readiness for future development.
- A further 19 storage tanks of varying in sizes were removed and disposed of from site, within the Stage Coach and Bus Depot areas.

Conclusion – The entire site contained a large range of storage tanks and vessels containing an extensive variety of chemicals and fuels, all of which required decommissioning and disposal. The site was handed back to the client with an Environmental clean bill of health, contaminant free and in readiness for redevelopment for the London Olympics.
